

Product Requirements and Design Document

1. Product overview

PrepCorex is a multi-role order management and warehouse management platform for prep centres, third-party logistics providers, warehouse operators, and seller clients. The TikTok Shop integration brings seller-authorized product, inventory, order, logistics, and fulfilment data into the warehouse workflow.

2. Problem

TikTok Shop sellers using an external fulfilment warehouse otherwise need to manually copy SKU, stock, order, and tracking information between systems. This increases fulfilment delays, stock inconsistency, and tracking errors.

3. Users and roles

- Seller client: authorizes their TikTok Shop, selects SKUs, views imported orders and inventory.
- Warehouse administrator/operator: processes approved warehouse work and sends dispatch tracking through the seller's authorized connection.
- TikTok reviewer: validates the end-to-end integration in an isolated environment using sample data.

4. Core use cases

1. Connect a seller-owned TikTok Shop using OAuth.
2. Retrieve shop identity and maintain authorized access.
3. Retrieve products, SKU identifiers, images, status, and available quantity.
4. Let the seller select only SKUs handled by PrepCorex.
5. Link selected SKUs to PrepCorex inventory.
6. Send an approved SKU inventory quantity to the relevant TikTok warehouse.
7. On demand, retrieve orders from the last 30 days and show fulfilment-relevant details.
8. Authorized admin creates/locates a fulfilment package and sends carrier/tracking after dispatch.
9. Disconnect the shop and remove its linked PrepCorex inventory when requested.
10. Webhook endpoint registered for Partner Center delivery verification (event processing planned).

5. User flow

1. An authenticated seller opens Dashboard to Integrations.
2. The seller clicks Connect on TikTok Shop.
3. PrepCorex redirects the seller to TikTok's authorization page.
4. TikTok redirects to PrepCorex's registered callback after consent.
5. PrepCorex exchanges the authorization code and stores the connection under that client.
6. The seller opens Manage products, searches/selects SKUs, and saves the selection.

7. PrepCorex links those SKUs to the client's inventory.
8. The seller opens TikTok Shop Orders and clicks Refresh to pull live order data.
9. An authorized admin opens Admin to TikTok Shop Orders, selects the client, and marks an order shipped with tracking (or inventory is pushed after warehouse dispatch).

6. Requested access and purpose

- seller.authorization.info: identify the authorized shop and connection.
- seller.product.basic: retrieve products, SKUs, images, status, and stock information.
- seller.product.write: update available inventory for a selected TikTok SKU.
- seller.order.info: retrieve orders and fulfilment-relevant order details.
- seller.logistics: retrieve TikTok warehouses and shipping providers.
- seller.fulfillment.basic: retrieve package and fulfilment information.
- seller.fulfillment.package.write: create/update package and tracking information.
- seller.delivery.status.write: report shipment/delivery status where required by the fulfilment flow.

Every requested permission must be visible in the submitted video. Remove any permission that is not used in the production workflow or cannot be demonstrated.

7. Data handling and security

- PrepCorex requires its own authenticated user session before initiating or using a TikTok connection.
- Connections are stored per PrepCorex client rather than globally.
- Server API routes verify the signed-in user's token before accessing connection data.
- Cross-client writes are restricted to authorized administrative workflows.
- App secrets and access tokens are server-side and are not exposed in screenshots or browser UI.
- Data is used only for the seller-authorized warehouse and fulfilment workflow.
- Privacy information: <https://prepcorex.com/api/platform-documents/privacy/pdf>
- Terms: <https://prepcorex.com/api/platform-documents/terms/pdf>

8. Acceptance criteria

- OAuth completes and returns the seller to PrepCorex.
- Connected shop identity appears on Integrations.
- Products/SKUs load and a selection can be saved.
- Selected SKUs appear in PrepCorex inventory.
- A test inventory update reaches the correct TikTok SKU and warehouse.
- Orders load with correct line items and status.
- A test dispatch sends valid carrier/tracking and TikTok reflects the update.
- Disconnect removes access without affecting another client's connection.
- Reviewer steps work from a clean browser using the supplied credentials.
